1 *Executive summary*

This report provides the documentation to support the potato breeding programmes underway at Crop and Food Research with financial support from Horticulture New Zealand.

Data from a number of trials are presented in the appendices.

A popular article that was published in the November 2006 issue of *Grower* is also appended.

Appendices

Appendix I: Potato Regional Trial Results 2006 Grower (November, 2006)

John Anderson and Russell Genet
Crop & Food Research

Over the past season 14 regional trials were conducted (the Ohakune trial was not planted because of poor weather) to assess the performance of advanced breeding lines from Crop & Food Research's potato breeding programme as well as recently imported lines from around the world. These trials were funded by Crop & Food Research, Horticulture New Zealand, and merchants. The assistance of growers on whose properties some of the trials were conducted is gratefully acknowledged.

To remain competitive with products around the world and with local food products, food processors, exporters and local fresh market growers will need to meet the increasingly specific and exacting requirements of their customers. New improved cultivars will be the cornerstone of future advances.

As in previous years, trials were conducted throughout the potato growing regions of the country. Most trials were run successfully. However, the very wet autumn in Canterbury resulted in some damage to plots at Lincoln. Also the Late Waikato trial resulted in high levels of hollow heart or fleck and lower dry matter content than would usually be expected from this site. Details are presented in Table 1.

A short summary of more recent lines entered in the trials is presented below.

MACRUSSET: A main crop French fry line with high yield and good processing quality. Dry matter contents were high in both trials but there were some tubers with pointed ends in South Canterbury and slight fleck at Palmerston North. Agent Eurogrow Potatoes.

MARABEL: An early fresh market line that yielded well in early trials although not as well as in previous years. Performed well in steaming tests and with relatively high dry matter content and good crisping tests may have a place as an early processor. Tubers are oval-shaped with yellow flesh. Agent: Eurogrow Potatoes.

MARLEN: A crisping line with good yield, good dry matter and low sugars and may have some resistance to cold induced sweetening. Only defects were at the late Waikato site with some hollow heart and fleck. Agent: Eurogrow Potatoes.

MILVA: A fresh market line with high yield but marginal appearance, mainly due to pear- or irregular-shaped tubers. Oval-shaped, yellow-fleshed tubers with lowish dry matter content performed well in steaming tests but not suitable for processing. Agent: Eurogrow Potatoes.

RIVERENA RUSSET: A French fry line with high yield and good frying quality. Tendency towards pear-shaped tubers in South Canterbury trial. The late Waikato site resulted in tubers with after-cooking greying, high sugars and some hollow heart. Agent: Eurogrow Potatoes.

94-2-9: A crisping line with medium to high dry matter. Below average yielding at both trial sites and, like most lines, suffered in the late Waikato trial. Agent: Eurogrow Potatoes.

HERMES: Above average yields at all five sites. Tubers had medium to high dry matter contents and produced good crisp scores. Some after-cooking greying was observed in steamed samples. Tubers tended to be slightly irregular in shape or suffered from slight secondary growth. Like most lines in the late Waikato trial, some hollow heart and fleck were observed in this trial.

CROP 22: A second early-main crop fresh market line although sugar levels are usually ok for processing. This line is bruise tolerant, yellow-fleshed and returned an attractive sample from Ohakune in the previous three years. Dry matter content is typically medium and steaming results good. Crisping tests from trials dug before June produced acceptable sugar levels but results from later trials were unreliable. This line was tendered by Crop & Food Research this year and will be marketed by the Ruahine syndicate.

CROP 25: Predominantly a fresh market line with bright waxy textured tubers suitable for boiling, salads and roasting. This line has a high yield potential from crops planted between mid-August and early December. Commercial evaluation is being conducted over this season.

CROP 32 This line has been 'on the shelf' for a couple of seasons, mainly because we wondered whether there was a large enough market to justify its release in New Zealand. Two reasons prompted us to tender it this year. Firstly it had been sent to Australia and our collaborators there have shown interest in promoting it as a specialist cultivar. It has been named Purple Passion in Australia. Secondly we would like to test the opportunity in the New Zealand market for something slightly more specialised and capable of attracting a higher value.

CROP 32 This line is an early-main crop potato suitable for the fresh market. The purple skin colour has a novelty/identification value but this is backed by an excellent cooking quality, especially when dug as a green top. Tubers are oval-shaped and sets are typically high so oversized tubers are uncommon. Tuber flesh is cream to pale yellow and physiological disorders are rare. This cultivar has good resistance to late blight, powdery scab and bacterial soft rot. While yields are not high, most tubers fall in a marketable component.

The major attraction of this cultivar is its cooking quality, showing excellent boiling/steaming results especially when dug slightly immature. The dry matter content is usually about 1.5% higher than that of Nadine. Licensing arrangements are under discussion.

4113-8 This line is the most promising of all the advanced breeding numbers. Apart from the Bombay first early trial and to a lesser extent the Birdlings second early trial, it has yielded well in all trials. Tubers are round to oval-shaped with white skin and cream flesh. An occasional tuber with hollow heart has been seen but other physiological disorders are rare. Dry matter content is usually medium to high. Both steaming and crisping tests gave very good results.

Table 1: Potato line performance in regional trials, 2005–06.

Trial site & maturity	Number of lines	Plant date	Harvest date	Control cultivar	Market yield (t/ha)	Most promising lines in trial

Acknowledgements:

The following growers are thanked for allowing trials to be conducted in their crops:

- Pinnacle Growers Ltd – Bombay first early
- Michael Bayley – Birdlings Flat early
- A S Wilcox and Sons – Waikato early main
- COEL Waikato – main and ground store
- Raymond Bowen – South Canterbury crisp and French fry
- Doug Whitfield – Ohakune
