

2024 Potato Tuber Moth

Potatoes NZ is working to help support growers in their management of Potato Tuber Moth (PTM). As part of this we have a monitoring system in place using pheromone traps to catch PTM within potato crops. These results are multiple paddocks, averaged for the given area (Pukekohe, Pukekawa, Tuakau, etc.). Please use this information in combination with in-field crop scouting to help make decisions around crop management.

The overall PTM pressure across the region has remained at 7 mot per day, although most areas have had a drop in numbers. Mangatawhiri remains the highest catch but has dropped to 14.5 moth per day (down from 19.5). Patumahoe remains high 12.5 moth per day (down from 15 per day) and Pukekawa 9 (down from 11 per day) also has high risk numbers.

There is variable larva pressure in crops, which highlights the importance of in field crop monitoring. Keep monitoring your soil for cracking, as cracking soil give moth/ larvae a direct route to tubers.
